W0. Introduction

W0.1

(W0.1) Give a general description of and introduction to your organization.

Berry Global Group, Inc. (NYSE: BERY), headquartered in Evansville, Indiana, is committed to its mission of ‘Always Advancing to Protect What’s Important,’ and proudly partners with its customers to provide them with value-added protective solutions that are increasingly light-weighted and easier to recycle or reuse. The Company is a leading global supplier of a broad range of innovative rigid, flexible, and nonwoven products used every day within consumer and industrial end markets. Berry, a Fortune 500 company, has over 46,000 employees and generated almost $14.5 billion of pro forma net sales in fiscal year 2022, from operations that span over 265 manufacturing locations on six continents. For additional information, visit Berry’s website at berryglobal.com. Data in this response aligns to our Fiscal Year, which ran from September 27th 2021 - October 1st, 2022.

W-CH0.1a

(W-CH0.1a) Which activities in the chemical sector does your organization engage in?

Other, please specify (Plastic converting)

W0.2

(W0.2) State the start and end date of the year for which you are reporting data.

<table>
<thead>

W1. Current state

W1.1

(W1.1) Rate the importance (current and future) of water quality and water quantity to the success of your business.

<table>
<thead>
<tr>
<th>Sufficient amounts of good quality freshwater available for use</th>
<th>Direct use importance rating: Important</th>
<th>Indirect use importance rating: Neutral</th>
<th>Please explain</th>
</tr>
</thead>
<tbody>
<tr>
<td>Direct use: Water is used directly for coding in our manufacturing processes, as well as in some of our other processes in our recycling facilities. Good quality freshwater is important because increased contaminants and deposits would require increased maintenance to our water systems, increasing maintenance costs to our company. Indirect use: The water used for upstream processes, such as resin manufacturing, is believed to account for a much greater water consumption than our direct consumption. Based on an industry-wide LCA of specific plastic conversion processes, upstream resin processing comprises approximately 80% of the total water footprint. The fabrication of other materials accounts for 10% and process water accounts for the remaining 10%. Electricity generation and transport fuels account for less than 1%. This is based on &quot;Life Cycle Inventory of Plastic Fabrication Processes Injection Molding and Thermforming&quot;, American Chemistry Council, 2011. However, this upstream process does not need as high quality water as direct use and recycled/brackish water is usually used. Because of this, there is less importance that there is sufficient amount of freshwater available (as opposed to brackish water), and we have marked this as neutral. Future dependence on the use of freshwater could differ more for our direct freshwater usage than indirect. As freshwater is primarily used in our operations a significant reduction or divestment of facilities would have an impact on our freshwater usage. We have a continual improvement target to reduce our water usage by 1% per year, which, if we continue to achieve our targets, we would see a reduction on future dependence on freshwater.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

| Sufficient amounts of recycled, brackish and/or produced water available for use | Not important at all | Important | Direct use: Recycled or brackish water are not used within our direct operations. Freshwater is our predominant water source as increased contaminants or deposits from other water sources would increase maintenance costs. Indirect use: The water used for upstream processes, such as resin manufacturing, is believed to account for a much greater water consumption than our direct consumption and does not need as high quality of water as direct use, therefore the use of brackish and recycled water becomes more important in our supply chain. Based on an industry-wide LCA of specific plastic conversion processes, upstream resin processing comprises approximately 80% of the total water footprint. The fabrication of other materials accounts for 10% and process water accounts for the remaining 10%. Electricity generation and transport fuels account for less than 1%. This is based on "Life Cycle Inventory of Plastic Fabrication Processes Injection Molding and Thermforming", American Chemistry Council, 2011. Future dependence on the use of brackish/recycled water is related to indirect usage of this water source in our supply chain and therefore dependent on an increase/decrease in our demand for resin. Through light weighting and other sustainability initiatives we have a vision to use less plastic in the future which would have an impact and a reduction on our indirect water usage. We do not anticipate brackish water being used in our direct operations in the future, so no change. |

W1.2
(W1.2) Across all your operations, what proportion of the following water aspects are regularly measured and monitored?

Water-related requirement
Providing fully-functioning, safely managed WASH services to all workers

% of suppliers with a substantive impact required to comply with this water-related requirement
<Not Applicable>

% of suppliers with a substantive impact in compliance with this water-related requirement
<Not Applicable>

Mechanisms for monitoring compliance with this water-related requirement
On-site third-party audit
Supplier self-assessment

Response to supplier non-compliance with this water-related requirement
Retain and engage

Comment
Our supplier code of conduct outlines that 100% of suppliers should work to reduce the environmental impacts of their operations including waste water discharges. Additionally suppliers shall provide its employees with a safe and healthy working environment in accordance with applicable local and national laws which shall include access to potable water and clean sanitation facilities.

W.1.5d
(W1.5d) Provide details of any other water-related supplier engagement activity.

Type of engagement
Information collection

Details of engagement
Collect information on water-related risks at least annually from suppliers

% of suppliers by number
100%

% of suppliers with a substantive impact
<Not Applicable>

Rationale for your engagement
We have quarterly meetings with our largest resin suppliers, which make up 100% of our critical suppliers by number, and over 50% of total procurement spend. Scope 3 emissions from our suppliers. We work to collaborate with these critical suppliers to understand potential climate risk, including water risk, issues within our supply chain.

Impact of the engagement and measures of success
By working to understand the water risks and water footprint within our supply chain this enables us to gain insights into how resilient our suppliers are to water-related disruptions, and allow for the exploration of joint initiatives to address water risk in the supply chain.

Comment

(W1.5e) Provide details of any water-related engagement activity with customers or other value chain partners.

Type of stakeholder
Customers

Type of engagement
Education / information sharing

Details of engagement
Run an engagement campaign to educate stakeholders about your water-related performance and strategy

Rationale for your engagement
The majority of our products and operations are not water intensive so we often prioritize the engagement on other topics such as the climate impact of our products and operations in our direct engagements with customers and other partners in our supply chain. We do however recognize the importance of water to our supply chain partners and customers. We publish information on water in our Impact Report and GRI reporting, detailing our management and use which is available to all supply chain partners on the Barry Global website (https://www.barryglobal.com/sustainability/howweperform). In the future we hope to add additional information related to water risk on our website. We also publish information on our water targets and strategy on the Barry Global website.

Impact of the engagement and measures of success
Engagement success is measured by the number of visitors to the sustainability section of our website or downloads of our GRI report.

W2. Business impacts

W2.1

(W2.1) Has your organization experienced any detrimental water-related impacts?

No

W2.2

(W2.2) In the reporting year, was your organization subject to any fines, enforcement orders, and/or other penalties for water-related regulatory violations?

<table>
<thead>
<tr>
<th>Water-related regulatory violations</th>
<th>Fines, enforcement orders, and/or other penalties</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>&lt;Not Applicable&gt;</td>
<td>We did not report any incidents for the 2022 fiscal year. Incidents are reported in the year in which the fines and/or sanction settlements are finalized to avoid inaccurate or duplicate figures being reported.</td>

<td>We do not have systems in place at group level to identify, classify and report on our potential water pollutants</td>
</tr>
</tbody>
</table>

W3.3

(W.3.3) Does your organization undertake a water-related risk assessment?
Yes, water-related risks are assessed

W3.3a

(W.3.3a) Select the options that best describe your procedures for identifying and assessing water-related risks.

- **Value chain stage**
  - Direct operations
  - Supply chain

- **Coverage**
  - Full

- **Risk assessment procedure**
  - Water risks are assessed as part of an established enterprise risk management framework

- **Frequency of assessment**
  - Annually

- **How far into the future are risks considered?**
  - More than 5 years

- **Type of tools and methods used**
  - Tools on the market
  - Enterprise risk management

- **Tools and methods used**
  - WRI Aqueduct

- **Contextual issues considered**
  - Water availability at a basin/catchment level
  - Water quality at a basin/catchment level
  - Stakeholder conflicts concerning water resources at a basin/catchment level
  - Implications of water on your key commodities/raw materials
  - Water regulatory frameworks
  - Status of ecosystems and habitats
  - Access to fully-functioning, safely managed WASH services for all employees

- **Stakeholders considered**
  - Customers
  - Employees
  - Investors
  - Local communities
  - NGOs
  - Regulators
  - Suppliers
  - Water utilities at a local level

- **Comment**
  - We use the WRI Aqueduct tool to assess current water risk and future water risk for 2030 and 2040 under a “business as usual” pathway scenario. After an annual analysis of our facilities at a high level using WRI, all high-risk sites are notified of their status and encouraged to investigate in best-practice for water use and water risk. High risk sites are also cross-referenced with above-average absolute or intensity water users, and those sites are considered highest risk. These highest risk sites are requested to have a consultation with the water risk management team to establish a water risk management plan and areas of improvement for reducing water use. In addition, we also verify with operational leadership that all of our sites meet minimum WASH expectations to eliminate contextual risks relating to sanitation. We use the EcoVadis platform CSR Questionnaire to identify environmental risk in our supply chain based on our suppliers answers and evidence provided on the questions related to water management.

W3.3b
W4. Risks and opportunities

W4.1

(W4.1) Have you identified any inherent water-related risks with the potential to have a substantive financial or strategic impact on your business?

Yes, only within our direct operations

W4.1a

(W4.1a) How does your organization define substantive financial or strategic impact on your business?

Borry Global defines substantive financial and strategic impact through a scale of impact that ranges from insignificant to catastrophic as set out below:

- **Insignificant** - Consequences can be readily absorbed under normal operating conditions
  - <1% on pre-tax earnings
  - No potential impact on market share
  - No impact on brand value
  - No resolution required

- **Significant** - Event which can be managed under normal operating conditions
  - 1% - 3% on pre-tax earnings
  - Minor potential impact on market share
  - Minor impact on brand value
  - Issues would be delegated to management / staff to resolve

- **Serious** - Major events which can be managed but require additional resources and management effort
  - 3% - 5% on pre-tax earnings
  - Market share and/or brand value will be affected in short term
  - Cash flow may be affected

As a result of our risk-management process, facility managers and divisional leaders for high-risk facilities are informed of their high-risk status and required to develop individual action plans at site level on how best to manage this potential risk. These plans are focused around implementing best-practice improvements for water efficiency and working with the local communities on water-related issues. In addition, high-risk facilities are cross-referenced with annual water intensity metrics, and those that have an above-average water intensity are classified as highest risk. These facilities must undertake specialized action plans in conjunction with the corporate water risk team to investigate in detail the current water requirements of the facility and identify projects to reduce water intensity. Additional water withdrawal and consumption reduction targets may be put in place for these facilities, to further prioritize efficiency improvement efforts and mitigate water-related risks on the facility and the surrounding community. Risk, including water risks, will also be identified through the annual enterprise level risk assessment with results of this submitted for review and approval by the Audit committee on behalf of the board. Any risks identified through this process are used to inform company strategy as part of the overall risk-scenario. Where suppliers score poorly in our EcoVadis Questionnaire, we can use the corrective action function to request improvement.
• The event will require senior management intervention

**Critical:** Critical event which can be endured but which may have a prolonged negative impact and extensive consequences

• 5% - 10% on pre-tax earnings

• Serious diminution in brand value / market share

• Cash flow may be adversely affected

• Key alliances are threatened

• Events and problems will require board / senior management attention

**Catastrophic:** Disaster with potential to lead to collapse of business that is fundamental to the achievement of objectives

• >10% on pre-tax earnings

• Imminent cash-flow problems

• Loss of key alliances

• Sustained serious loss in market share

When defining substantial financial or strategic impacts of water risk on our direct business, Berry uses the WRI aqueduct tool. The tool identifies risk categories for a number of water-related issues, both current and future. Berry, based on a business-as-usual scenario (baseline water stress in 2030 and 2040), has established benchmarks for overall water risk. Each site in our business is graded within these categories as low, medium, high, very high, or extremely high risk. Berry considers any of its sites to have high water risk if they have either;

a) An “extremely high” risk in water quantity, quality or regulatory & reputational risk

b) A “high risk” risk in current or future baseline water stress

c) A “high risk” risk in the overall risk category.

These sites are considered to be at risk of impacting the business and therefore are made aware of their risk, and expected to work with best-practices to mitigate their risk. To outline sites where the risk is substantive financially or strategically, we cross-reference this list with the sites’ absolute water withdrawals or water intensity. Any high risk sites that have either;

a) Above average annual absolute water withdrawals

b) An above average annual water withdrawal intensity

are considered those with substantive impact. These sites must develop individual water risk strategies through consultation with the water risk team. Ultimately, water risk is one of many factors that could affect where we produce our goods. As an example, where a substantive risk has been identified at a site it may make sense to move production from this to another site with low water risk. That would have to be balanced vs. other factors such as available technologies to significantly reduce water consumption. An increase in water costs and availability would impact our supply chain as well as direct operations. This definition applies to our direct operations only, and has not been applied to our supply chain.

W4.1b

(W4.1b) What is the total number of facilities exposed to water risks with the potential to have a substantive financial or strategic impact on your business, and what proportion of your company-wide facilities does this represent?

## W4.2
(W4.2) Provide details of identified risks in your direct operations with the potential to have a substantive financial or strategic impact on your business, and your response to those risks.

Country/Area & River basin

| Philippines | Other, please specify (Laguna de Bay) |

Type of risk & Primary risk driver

| Acute physical | Flood (coastal, fluvial, pluvial, groundwater) |

Primary potential impact
Reduction or disruption in production capacity

Company-specific description
There are identified risks at each of the sites outlined in W4.1C, identified by WRI aqueduct tool. One of these, as outlined in this response, was the extremely high water quantity risk; risk of flooding on site, causing disruption to production and possible costs for prevention and repairs. In the event on a full flood this could cause site closure for an extended period, up to a full reporting period.

Timeframe
More than 6 years

Magnitude of potential impact
Medium-low

Likelihood
About as likely as not

Are you able to provide a potential financial impact figure?
Yes, an estimated range

Potential financial impact figure (currency)
<Not Applicable>

Potential financial impact figure - minimum (currency)
1000000

Potential financial impact figure - maximum (currency)
5000000

Explanation of financial impact
The potential financial impact of flooding has been estimated based on the complete closure of the site due to the flooding, losing a full year's reporting profit. The impact could total the full reporting profit for the site.

Primary response to risk
Develop flood emergency plans

Description of response
Emergency and continuity procedures for businesses are held locally. Sites have established protocols and procedures to ensure business continuity in the event of a major incident.

Cost of response
100000

Explanation of cost of response
It is hard to provide estimates for the full cost of each site as it includes a variety of elements including flood insurance, which are part of site operational costs defined on a local basis. We estimate the response to require around $100,000 of investment.

W4.2c

(W4.2c) Why does your organization not consider itself exposed to water risks in its value chain (beyond direct operations) with the potential to have a substantive financial or strategic impact?

<table>
<thead>
<tr>
<th>Primary reason</th>
<th>Please explain</th>
</tr>
</thead>
</table>
| Risks exist, but no substantive impact anticipated | While the production of resin is more water intensive than converting plastic resin, we have multiple key suppliers all over the world, which reduces our risk at any given location. Further, resin suppliers are typically located next to large bodies of water to ensure availability, which reduces the potential impact of baseline water stress and drought.

W4.3

(W4.3) Have you identified any water-related opportunities with the potential to have a substantive financial or strategic impact on your business?

Yes, we have identified opportunities, and some/all are being realized

W4.3a
(W4.3a) Provide details of opportunities currently being realized that could have a substantive financial or strategic impact on your business.

Type of opportunity
Efficiency

Primary water-related opportunity
Improved water efficiency in operations

Company-specific description & strategy to realize opportunity
Water efficiency improvement opportunities are being realized across our HHS division, with a number of projects expecting to be completed by the end of fiscal year 2022. Municipal water is currently being wasted due to overfilling of water bath, and tank leaks from old lines, leading to a waste of water and a potential H&S Slip hazard. This can also cause the manufacturing lines to stop during clean-ups. There is an opportunity to install a technical solutions on-site to have automatic-fill water levels and install technical solutions to improve filtration and prevent leaks. These opportunities have a strategic impact on these individual sites as they reduce water usage, have capital savings, and reduce the water risk rating of these facilities. Additionally, best practice learned during these projects can be used across the rest of our business having further substantive impact; and can further reduce the number of “highest risk” facilities. We expect these projects to be completed by the end of FY22.

Estimated timeframe for realization
Current - up to 1 year

Magnitude of potential financial impact
Low-medium

Are you able to provide a potential financial impact figure?
Yes, a single figure estimate

Potential financial impact figure (currency)
700000

Potential financial impact figure – minimum (currency)  
<Not Applicable>

Potential financial impact figure – maximum (currency)  
<Not Applicable>

Explanation of financial impact
Implementation of these projects will firstly, reduce the spend on water, with a potential saving of up to 250,000 cubic meters annually, and also provide further capital savings through the reduction of lost manufacturing due to lines being suspended due to cleaning, which is required more frequently on older lines. This totaled, has the potential to save up to $700,000 dollars per year.

0

Discharges to groundwater
0

Discharges to third party destinations
41.6

Total water consumption at this facility (megaliters/year)
13.6

Comparison of total consumption with previous reporting year
Much lower

Please explain
The majority of water consumption on site is through evaporation, which is required as part of the manufacturing process at this facility. Production decreased at the facility, which meant much less water was withdrawn for the process, and therefore consumed during evaporation. The decrease in withdrawals was greater than 5% change, so we have marked this as "much lower", as was the consumption. Despite much less water being withdrawn, as much less water was consumed, discharges only fell year over year, by more than 1% but less than 5%, so we have marked this as "lower".

Facility reference number

19.3

Total water consumption at this facility (megaliters/year)
2.1

Comparison of total consumption with previous reporting year
About the same

Please explain
The majority of water withdrawn by the facility is used for cooling, before being discharged - with some additional water being consumed in canteens areas. A small amount can also be attributed to where water has been stored across reporting periods. Production increased at the facility, which meant more water was withdrawn for the process, and therefore more water was discharged. We have marked both categories as “higher” as the increase was greater than 1% but less than 5%. Water consumption remained steady (less than 1% change) as it is not tied to the increase in production, so we have marked this as “about the same”.

0.3

Comparison of total consumption with previous reporting year
About the same

Please explain
The majority of water withdrawn by the facility is used for cooling, before being discharged - with some additional water being consumed in canteens areas. The site uses an on-site well to supply the majority of water required for the cooling process, which is then discharged back into groundwater. Additional supply from third-parties is used to cope with additional production demand. Water withdrawals, discharge and consumption all remained steady year over year, with a less than 1% change.

Total water consumption at this facility (megaliters/year)
3.1
Comparison of total consumption with previous reporting year
About the same
Please explain
The majority of water consumption on site is lost through evaporation, with some water being consumed in canteens areas. A small amount can also be attributed to where water has been stored across reporting periods. The site withdrew and discharged a much smaller amount of water compared to the previous year (decrease of greater than 10% in each category), as a result of water efficiency projects that have been completed on site. The amount consumed remained around the same amount as the previous year (less than 1% change).

Total water consumption at this facility (megaliters/year)
3.2
Comparison of total consumption with previous reporting year
Much lower

Please explain
The majority of water consumption on site is lost through evaporation, with some water being consumed in canteens areas. A small amount can also be attributed to where water has been stored across reporting periods. The site implemented water consumption efficiency improvements, which led to water consumption being much lower than in the previous year. An increase in volume lead to a increase in withdrawals (greater than 1% and less than 5%) and a combination of both factors meant discharge had a large increase (greater than 5%).

Total water consumption at this facility (megaliters/year)
1.4

Comparison of total consumption with previous reporting year
About the same

Please explain
The majority of water withdrawn by the facility is used for cooling, before being discharged - with some additional water being consumed in canteens areas. A small amount can also be attributed to where water has been stored across reporting periods. Production decreased at the facility, which meant much less water was withdrawn for the process, and therefore much less water was discharged. We have marked both categories as "much lower" as the increase was greater than 5%. Water consumption remained steady (less than 1% change) as it is not tied to the increase in production, so we have marked this as "about the same".

Our sustainability policy and related strategy, which includes a focus on water, is available company-wide and distributed to all facility managers. We believe it is important to formalize a company-wide reduction target that is a part of our Impact 2035 sustainability strategy. The policy can be found here: https://www.berryglobal.com/sustainability-policy. Similarly, we also have an Environmental Management Policy which includes water management, which can be found here: https://www.berryglobal.com/merchants/berryfiles/comp/sustainability/environmental-management-policy-2023.pdf. We have also aligned to the SDGs including SDGx 6 and 14, in a separate document also available to download from our website (https://www.berryglobal.com/mediaberry/files/sustainability-resources/berry-unsdg-index-2022-report.pdf).

W6.2

(W6.2) Is there board level oversight of water-related issues within your organization?

Yes.

W6.2a

(W6.2a) Identify the position(s) (do not include any names) of the individual(s) on the board with responsibility for water-related issues.

<table>
<thead>
<tr>
<th>Position of individual or committee</th>
<th>Responsibilities for water-related issues</th>
</tr>
</thead>
<tbody>
<tr>
<td>Board Chair</td>
<td>Our entire Board of Directors has responsibility for approving our corporate goals, including greenhouse gas emissions, energy, waste, and water intensity reductions. Our Executive VP of Operations is responsible for recommending water reduction goals to the Board. Our Executive VP of Operations, whom is on our CEO’s staff, is then ultimately responsible for driving improvements at our manufacturing facilities in order to meet these goals. An example of a water-related decision made by the Board is the inclusion of a water reduction target in the Berry Global Impact 2035 sustainability strategy. Our sustainability goal is to reduce company-wide water intensity (total water withdrawn/total production tonnage) by 1% per year, every year.</td>
</tr>
</tbody>
</table>

W6.2b
(W6.2b) Provide further details on the board’s oversight of water-related issues.

<table>
<thead>
<tr>

<th>Explain why your organization does not have at least one board member with competence on water-related issues and any plans to address board-level competence in the future</th>
</tr>
</thead>
<tbody>
<tr>
<td>No, and we do not plan to address this within the next two years</td>
<td>(Not Applicable)</td>
<td>Important but not an immediate priority</td>
<td>As The Berry Global board has had increased oversight of ESG climate related issues, we have felt the need for increased competence on the board in regards to climate and ESG as a whole, though this requirement has only gained importance over the last few years. We are working to ensure that within the next two years, at least one member of the board has been trained, or has pre-existing competence on ESG, and specifically climate-related, issues. Water-related issues are less material to our business than climate-related issues, so competence in this area is not prioritized.</td>
</tr>
</tbody>
</table>

W6.3
(W6.3) Provide the highest management-level position(s) or committee(s) with responsibility for water-related issues (do not include the names of individuals).

Name of the position(s) and/or committee(s)
Chief Executive Officer (CEO)

Water-related responsibilities of this position
Assessing water-related risks and opportunities
Managing water-related risks and opportunities
Setting water-related corporate targets
Monitoring progress against water-related corporate targets
Integrating water-related issues into business strategy
Managing water-related acquisitions, mergers, and divestitures

Frequency of reporting to the board on water-related issues
Quarterly

Please explain
The Berry Global CEO, whom is also the Chairman of the Berry Global Board, holds overall responsibility, along with the board for corporate strategy governance, performance, internal controls and risk management. The responsibility for water-related issues therefore rests ultimately with the CEO and the Berry Global board. Water-related issues are monitored by the CEO and the board as these are raised by the Chief Legal Officer as part of the company annual Enterprise Risk Assessment process as reported to the Berry Global Nominating and Governance Committee, Audit Committee, Chief Strategy Officer or the Executive VP Operations. The Chief Strategy Officer and his team, inclusive of the company VP Sustainability, also raise water-related issues to the CEO independent of the Enterprise Risk Assessment as they arise.

W6.4

</thead>
<tbody>
<tr>
<td>No, and we do not plan to introduce them in the next two years</td>
<td></td>
</tr>
</tbody>
</table>

W6.5

(W6.5) Do you engage in activities that could either directly or indirectly influence public policy on water through any of the following?

No

W6.6

(W6.6) Did your organization include information about its response to water-related risks in its most recent mainstream financial report?

No, and we have no plans to do so

W7. Business strategy

W7.1

(W7.1) Are water-related issues integrated into any aspects of your long-term strategic business plan, and if so how?

<table>
<thead>
<tr>
<th>Are water-related issues integrated?</th>
<th>Long-term time horizon (years)</th>
<th>Please explain</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes, water-related issues are integrated</td>
<td>11-15</td>
<td>Our sustainability goals include both a near-term goal to reduce water intensity, based on water withdrawals, by 1% per year as well as a long-term goal to have base-case water efficiency. When determining cost structure for new equipment the lifetime of the maintenance and water savings are included in ROI, with equipment lifetime generally being 10-15 years. As part of our assessment using the WHR water risk tool we identify sites with predicted long term water stress (up to 2030/2040) and incorporate this into long term business planning. This is consistent with an 11-15 year time horizon.</td>
</tr>
</tbody>
</table>

Strategy for achieving long-term objectives

| Yes, water-related issues are integrated | 11-15 | By monitoring and reporting on annual water use, we are finding ways to reduce our water intensity. Our sustainability committee looks at water savings when determining opportunities and risk for long term economics. As part of our assessment using the WHR water risk tool we identify sites with predicted long term water stress (up to 2030/2040) and incorporate this into long term business planning. This is consistent with an 11-15 year time horizon. The lifetime of equipment and ROI are important for determining the projects priority, with equipment lifetime generally being 10-15 years. Purchased water is additionally included as part of our scope 3 GHG calculation, for which we have set a net-zero target for 2050. Investigation in opportunities for volume reduction of water purchases is integrated as part of our strategy to achieve our net-zero goal and our intermediate goals in 2030, 2035 and 2040. |

Financial planning

| Yes, water-related issues are integrated | 11-15 | Water issues are integrated into long-term strategic business plans as part of our overall goal of reducing unnecessary water usage, and therefore, unnecessary spend. Long term financial includes water-related issues, particularly where savings can be made alongside water reductions, with an initial investment. When determining equipment upgrades, the ROI over the lifetime of the equipment (with equipment lifetime generally being 10-15 years), includes water reductions and water quality. |
W7.2

(W7.2) What is the trend in your organization’s water-related capital expenditure (CAPEX) and operating expenditure (OPEX) for the reporting year, and the anticipated trend for the next reporting year?

Row 1

Water-related CAPEX (+/- % change)
2

Anticipated forward trend for CAPEX (+/- % change)
1

Water-related OPEX (+/- % change)
-6

Anticipated forward trend for OPEX (+/- % change)
-1

Please explain:

Water withdrawal intensity decreased 2% during the reporting period as a result of an increase in CAPEX spend on increasing water efficiency of 1%, which was achieved. With continued efforts to reduce water intensity in line with our target of 1% year on year (YoY), Berry anticipates a forward increase in CAPEX spend of 1% YoY to facilitate this. Overall water withdrawals decreased 8% during the reporting year, resulting in a water OPEX spend decrease of around 6%. Water withdrawal decreases run in line with production decreases, but are offset by the CAPEX projects to increase water efficiency. Berry anticipate a forward trend of a -1% reduction in OPEX spend in line with further improvements to reduce water withdrawals.

W7.3

(W7.3) Does your organization use scenario analysis to inform its business strategy?

<table>
<thead>
<tr>
<th>Use of scenario analysis</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes (1)</td>
<td>When developing our Impact 2025 Sustainability Strategy, we used the 2DS climate-related scenario to model the impact on operations in comparison to a business-as-usual pathway, such as the IEA STEPS. Results of the scenario analysis determined the extent of the target for reductions in our strategy, and potential climate risks and opportunities - which ties in with water risks. As a direct result of the 2DS analysis, water reduction targets were calculated, and annual capex availability for projects was put in place. We are driving a clear focus on energy, water and GHG emissions reduction across the business to ensure emissions reductions are in line with our strategy and climate modelling. Over the last year we have expanded our Impact 2025 strategy based on the IEA NZE2050 (Net-Zero Emissions by 2050 Scenario) pathway, which is compatible with modelling to limit warming to 1.5 degrees Celsius by 2100, and are looking into whether our water target needs to be updated appropriately.</td>
</tr>
</tbody>
</table>

W7.3a

(W7.3a) Provide details of the scenario analysis, what water-related outcomes were identified, and how they have influenced your organization’s business strategy.

<table>
<thead>
<tr>
<th>Type of scenario analysis used</th>
<th>Parameters, assumptions, analytical choices</th>
<th>Description of possible water-related outcomes</th>
<th>Influence on business strategy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Climate-related</td>
<td>When developing our Impact 2025 Sustainability Strategy, we used the 2DS climate-related scenario to model the impact on operations in comparison to a business-as-usual pathway, such as the IEA STEPS (Stated Policies Scenario). Over the last year we have expanded our Impact 2025 strategy based on the IEA NZE2050 (Net-Zero Emissions by 2050 Scenario) pathway, which is compatible with modelling to limit warming to 1.5 degrees Celsius by 2100; we have also set an appropriately science-based GHG emissions reduction target, approved by the SRTI.</td>
<td>Results of the scenario analysis determined the extent of water risk within our direct operations under each scenario. Using the scenarios, alongside WRI aqueduct tool, we can assess current water risk and future water risk for 2030 and 2040 under a “business-as-usual” pathway scenario vs additional pathways. Under the IEA NZE 2050 pathway, the water risks on our facilities are significantly reduced, as are the financial costs associated with these risks, and with water-related costs. Additionally, the price of the resources we purchase, which requires a large amount of brackish water for cooling, and is often produced in regions of high-water risk, is far lower under these scenarios vs business as usual.</td>
<td>Results of the scenario analysis determined the extent of the target for GHG emissions reductions in our strategy, and analysis for potential climate risks and opportunities - which ties in with water risks. As a direct result of the analysis, global energy and water reduction targets were calculated, and annual capex availability for projects was put in place. We are driving a clear focus on energy, water and GHG emissions reduction across the business to ensure reductions are in line with our strategy and climate modelling.</td>

</table>

W7.4
(W7.4) Does your company use an internal price on water?

Row 1

Does your company use an internal price on water?
No, and we do not anticipate doing so within the next two years
Please explain

W7.5

(W7.5) Do you classify any of your current products and/or services as low water impact?

<table>
<thead>
<tr>
<th>Products and/or services classified as low water impact</th>
<th>Definition used to classify low water impact</th>
<th>Primary reason for not classifying any of your current products and/or services as low water impact</th>
<th>Please explain</th>
</tr>
</thead>
<tbody>
<tr>
<td>Row 1</td>
<td>&lt;Not Applicable&gt;</td>
<td>Lack of internal resources</td>
<td>We have not yet analysed life-cycle analyse of our products vs alternative materials to determine, and certify, their water impact comparisons.</td>
</tr>
</tbody>
</table>

W8. Targets

W8.1

(W8.1) Do you have any water-related targets?
Yes

W8.1a

(W8.1a) Indicate whether you have targets relating to water pollution, water withdrawals, WASH, or other water-related categories.

<table>
<thead>
<tr>
<th>Target set in this category</th>
<th>Please explain</th>
</tr>
</thead>
<tbody>
<tr>
<td>Water pollution</td>
<td>No, and we do not plan to within the next two years Water pollution is managed at a site-level, in compliance with all local and regional requirements. Currently we do not feel an additional corporate goal is required on this topic.</td>
</tr>
<tr>
<td>Water withdrawals</td>
<td>Yes &lt;Not Applicable&gt;</td>
</tr>
<tr>
<td>Water, Sanitation, and Hygiene (WASH) services</td>
<td>Yes &lt;Not Applicable&gt;</td>
</tr>
<tr>
<td>Other</td>
<td>No, and we do not plan to within the next two years We do not feel that there are any other water-related aspects material to us that require a corporate target in place.</td>
</tr>
</tbody>
</table>

W8.1b
(W8.1b) Provide details of your water-related targets and the progress made.

Target reference number
Target 1

Category of target
Water withdrawals

Target coverage
Company-wide (direct operations only)

Quantitative metric
Reduction in withdrawals per unit of production

% of target achieved relative to base year
250.00000000001

Target status in reporting year
Achieved

Please explain
Our water withdrawal intensity decreased by 2.3% in FY22 compared to FY21, which far exceeded our target of 1%. This was as a result of increased efficiency of water usage at our facilities initiated by a drive in continuous improvement.

Target reference number
Target 2

Category of target
Water, Sanitation and Hygiene (WASH) services

Target coverage
Company-wide (direct operations only)

Quantitative metric
Increase in the proportion of employees using safely managed sanitation services, including a hand-washing facility with soap and water

Target status in reporting year
Achieved

Please explain
Safety is a top priority at Berry. The safety of our workers includes safe water and sanitation. We do not accept anything less than 100% access to water and sanitation at all our facilities, every year. At this time, we have verified with operational leadership that all of our sites meet minimum WASH expectations. Safety is the number one value for Berry and it is the responsibility of Berry to provide a safe and responsible working environment to employees.

W9. Verification
W9.1

(W9.1) Do you verify any other water information reported in your CDP disclosure (not already covered by W5.1a)?

No, but we are actively considering verifying within the next two years

W10. Plastics

W10.1

(W10.1) Have you mapped where in your value chain plastics are used and/or produced?

<table>
<thead>
<tr>
<th>Plastics mapping</th>
<th>Value chain stage</th>
<th>Please explain</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>We are a plastics converter and recycler, and therefore plastics are relevant in all aspects of our business including risk.</td>
</tr>
</tbody>
</table>

W10.4

(W10.4) Do you have plastics-related targets, and if so what type?

<table>
<thead>
<tr>
<th>Targets in place</th>
<th>Target type</th>
<th>Target metric</th>
<th>Please explain</th>
</tr>
</thead>
<tbody>
<tr>
<td>Row 1</td>
<td>Yes</td>
<td>Plastic packaging, Microplastics, Waste management</td>
<td>As a plastic converter, we have multiple targets relating to plastic packaging, including targets to:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Reduce the total weight of plastic packaging used and/or produced</td>
<td>- Achieve 100% reusable, recyclable, or compostable packaging by 2025</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Eliminate problematic and unnecessary plastic packaging</td>
<td>- Lightweight products</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Reduce the total weight of virgin content in plastic packaging</td>
<td>- Increase use of circular plastics</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Increase the proportion of post-consumer recycled content in plastic</td>
<td>- Achieve 18% recycled content across our packaging by 2025</td>
</tr>
<tr>
<td></td>
<td></td>
<td>packaging</td>
<td>In addition, we also have targets relating to operational waste management,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Increase the proportion of renewable content from responsibly managed</td>
<td>including management of plastic resin/microplastics waste.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>sources in plastic packaging</td>
<td>- Reduce landfill intensity by 5% year over year</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Increase the proportion of plastic packaging that is recyclable in practice and at scale</td>
<td>- Prevent resin loss through OCS</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Increase the proportion of plastic packaging that is reusable</td>
<td>- Implement OCS at acquisition sites within the first year</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Increase the proportion of plastic packaging that is compostible</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Reduce the potential release of microplastics and plastic particles</td>
<td></td>
